

ABSTRACT

A propylene resin composition comprising (A) a crystalline propylene block copolymer in an amount of 89 to 30% by weight, which has a specific content of a 23°C n-decane-soluble component, said soluble component having a specific intrinsic viscosity $[\eta]_a$ as measured in decalin at 135°C, has a specific melt flow rate (MFR, 230°C, load of 2160 g), and has a specific isotactic pentad fraction of a polypropylene homopolymer portion as measured by $^{13}\text{C-NMR}$, (B) a crystalline propylene block copolymer in an amount of 5 to 25% by weight, which has a specific content of a 23°C n-decane-soluble component, said soluble component having a specific intrinsic viscosity $[\eta]_b$ as measured in decalin at 135°C, has a specific melt flow rate (MFR, 230°C, load of 2160 g), and has a specific isotactic pentad fraction of a polypropylene homopolymer portion as measured by $^{13}\text{C-NMR}$, (C) an elastomeric polymer in an amount of 1 to 20% by weight, which has a melt flow rate (MFR, 230°C, load of 2160 g) of 0.5 to 30 g/10min, and (D) an inorganic filler in an amount of 5 to 25% by weight.
